Module G - Text Related Algorithms: Overview

- CYK **parsing** algorithm (this lecture)
- Text **compression**
 - Huffman compression
 - Lempel-Ziv compression

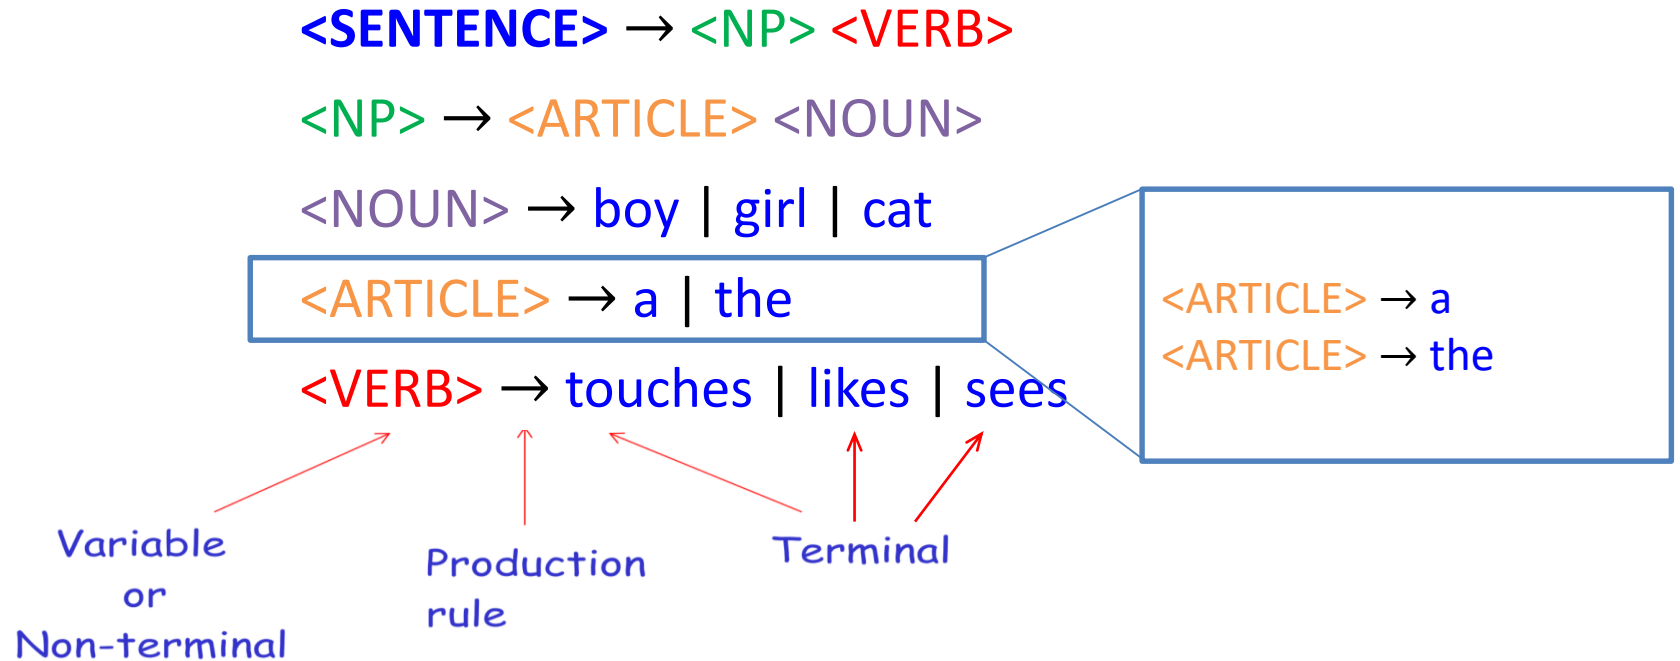

Lecture Plan

- Grammars (reminder)
- Context-free grammars (CFG)
- CFG's in Chomsky normal form (CNF)
- Parsing a string (CYK algorithm)

Grammars (reminder)

- The syntax of a programming language is formally defined using a **Grammar**
 - Similar to the case of **Natural Language**, yet with much less irregularities
- Before evaluating your program, the interpreter (e.g. IDLE) verifies that it **conforms** to the Grammar

Example (reminder)

Which of the following strings can be formed using this grammar?

“a girl likes” ✓

“the boy sees” ✓

“the girl likes the cat” ✗

Context-Free Grammars (CFG): Motivation

- In this lecture we focus on an important, restricted **type of grammar** called **Context-Free Grammar (CFG)**.
- Context-free grammars arise in **linguistics** and **natural language processing** (NLP), where they are used to describe the structure of sentences and words in a natural language.

Context Free Grammars (CFG)

- In a context free grammar, each rule has the form:

$\langle \text{single_variable} \rangle \rightarrow \dots$

- That is, LHS is always a **single variable**
- In words, rules can be applied **regardless of the context** of a variable. No matter which symbols surround it, the single variable on the left-hand side can always be replaced by the right-hand side.
- This is what distinguishes it from **context-sensitive** grammars, which allow rules of the form:

$xAy \rightarrow xBy$

- A can be replaced by B only if it appears “in the context” xAy

CFG: Example 1

Grammar G_1 :

Variables = $\{A, B\}$

Terminals = $\{0, 1, \#\}$

Rules: ▶ $A \rightarrow 0A1$

▶ $A \rightarrow B$

▶ $B \rightarrow \#$

Start Variable: A

Derivation with G_1 :

$A \rightarrow 0A1$
 $\rightarrow 00A11$
 $\rightarrow 000A111$
 $\rightarrow 000B111$
 $\rightarrow 000\#111$

Question 1

What strings can be generated in this way from the grammar G_1 ?

Answer: Exactly those of the form $0^n\#1^n$ ($n \geq 0$).

Generating Strings from CFG

1. Write down the **start variable**.
2. **Repeat** until **no variables remain**.
 1. Pick a variable X written down in current string and a derivation $X \rightarrow w$.
 2. Replace X with w .
3. Return final string (must contain only terminals)

CFG: Formal Definitions

A **context-free grammar** is a 4-tuple (V, Σ, R, S) , where

- ▶ V is a finite set of **variables**
- ▶ Σ is a finite set of **terminals** $(V \cap \Sigma = \emptyset)$
- ▶ R is a finite set of **rules** of the form $A \rightarrow x$, where $A \in V$ and $x \in (V \cup \Sigma)^*$.
- ▶ $S \in V$ is the **start symbol**.
- ▶ Let $u, v \in (V \cup \Sigma)^*$. If $(A \rightarrow w) \in R$, then uAv **yields** uwv , denoted $uAv \rightarrow uwv$.
- ▶ $u \xrightarrow{*} v$ if $u = v$, or $u \rightarrow u_1 \rightarrow \dots \rightarrow u_k \rightarrow v$ for some sequence u_1, u_2, \dots, u_k

Note that if $A \xrightarrow{*} xBy$ and $B \xrightarrow{*} z$, then $A \xrightarrow{*} xzy$.

The **language of the grammar** G , denoted $\mathcal{L}(G)$, is $\{w \in \Sigma^* : S \xrightarrow{*} w\}$

where $\xrightarrow{*}$ is determined by G .

CFG: Example 2

Grammar G_2 :

Variables = $\{S\}$

Terminals = $\{a, b\}$

Rules: $S \rightarrow aSb \mid SS \mid \epsilon$

Start Variable: S

$(\epsilon = \text{empty string})$

Some words in the language: $aabb$, $aababb$.

Question 3

What is this language?

Hint: Think of parentheses: i.e., a is "(" and b is ")". $()$, $()()$

Using larger alphabet (i.e., more terminals), $([]())$, represent well formed programs with many kinds of nested loops, "if then/else" statements.

Parse Trees: Example 1

Grammar G_1 :

Variables = $\{A, B\}$

Terminals = $\{0, 1, \#\}$

Rules:

- ▶ $A \rightarrow 0A1$
- ▶ $A \rightarrow B$
- ▶ $B \rightarrow \#$

Start Variable: A

The (unique) derivation sequence from A to $000\#111$:

$A \rightarrow 0A1 \rightarrow 00A11 \rightarrow 000A111 \rightarrow 000B111 \rightarrow 000\#111$

Parse Trees

Definition 10 (parse tree)

A labeled tree T is a **parse tree** of CFG $G = (V, \Sigma, R, S)$, if

- ▶ Inner nodes labels by elements of V .
- ▶ Leaves are labeled by elements of $V \cup \Sigma \cup \{\epsilon\}$.
- ▶ If n_1, \dots, n_k are the labels of the direct descendants (from left to right) of a node labeled A , then $(A \rightarrow n_1, \dots, n_k) \in R$

The **yield** of T , are the labels of all its leaves ordered written from left to right.

Parse Trees: Example 2

- It may be the case for a string to have **more** than a **single derivation sequence**, represented by the **same tree**.
- For example:

Grammar G_3 :

Variables = $\{S\}$

Terminals = $\{x, y, z, +, *\}$

Rules: $S \rightarrow S * S \mid S + S \mid x \mid y \mid z$

Start Variable: S

- 2 derivation sequences for $x + y * z$:
 - $S \rightarrow S * S \rightarrow S + S * S \rightarrow x + S * S \rightarrow x + y * S \rightarrow x + y * z$
 - $S \rightarrow S * S \rightarrow S + S * S \rightarrow S + S * z \rightarrow x + S * z \rightarrow x + y * z$
- Here, the only difference is the **order** in which we apply the rules

Parse Trees: Example 2

- But it may be the case for a string to have **more** than a **single parse tree**.
- For example:

- $S \rightarrow S * S \rightarrow S + S * S \rightarrow x + S * S \rightarrow x + y * S \rightarrow x + y * z$
- $S \rightarrow S * S \rightarrow S + S * S \rightarrow S + S * z \rightarrow x + S * z \rightarrow x + y * z$
- $S \rightarrow S + S \rightarrow S + S * S \rightarrow S + S * z \rightarrow x + S * z \rightarrow x + y * z$

- This **ambiguity** raises a problem: the same string may have more than a single **evaluation**. We will not deal with this here.

Checking Membership

Challenge

Given a CFG G and a string w , decide whether $w \in \mathcal{L}(G)$?

Initial Idea: Design an algorithm that tries **all derivations**.

Problem: If G does **not** generate w , we'll never stop.

Possible solution: Use special grammars that are:

- ▶ just as expressive!
- ▶ better for checking membership.

Chomsky Normal Form (CNF)

CFG's in Chomsky Normal Form (CNF)

A **simplified**, canonical form of context free grammars.

$G = (V, \Sigma, R, S)$ is in a CNF, if every rule in R has one of the following forms:

$$\begin{aligned} A &\rightarrow a, & A \in V \wedge a \in \Sigma \\ A &\rightarrow BC, & A \in V \wedge B, C \in V \setminus \{S\} \\ S &\rightarrow \varepsilon. \end{aligned}$$

Simpler to analyze: each derivation adds (at most) a single terminal, S only appears once, ε appears only at the empty word

What does parse tree look like?

“Most” internal nodes are of degree 2, except parents of leaves that have degree 1.

Generality of CNF

- Theorem (proof omitted):
Any CFG can be converted into an equivalent grammar in Chomsky Normal Form.
- Disadvantages of CNF: (1) may require more variables & rules (2) may be artificial: relation to problem domain less obvious
- Advantages of CNF : simpler, allows more rigorous mathematical study and the construction of efficient parsing algorithms (one of which we will see now)

CYK Parsing Algorithm For **CFG** in **CNF**

Recognition & Parsing

- A context-free grammar G defines a context-free language $L(G)$
- We would like to be able to test whether a string st belongs to the language $L(G)$ (aka recognition, or membership checking problem)
- Sometimes we are also interested in producing a **parse tree** for st (parsing)
 - This is more costly
 - st may have many(!) parses (this is termed ambiguity)

The CYK Algorithm

- Named after Cocke-Younger-Kasami
- A recognition and parsing algorithm suitable for languages defined by context-free grammars in CNF
- Uses “dynamic programming”: Composes the solutions from solutions to sub-problems that are stored in a table
- Instead of recursion, it works in a bottom-up fashion

CYK: Description

- Let $n = |st|$
- The algorithm constructs an $n \times (n + 1)$ table T , whose cells represent all possible consecutive substrings of st
 - cell $T[i][j]$ represents the substring $st[i:j]$
 - Thus, cell $T[0][n]$ represents the whole string $st[0:n] = st$
- We assign a variable A to cell $T[i][j]$ if $st[i:j]$ can be generated from A
- The algorithm will first consider all substrings of length 1 (where $j = i + 1$), then substrings of length 2, and so on

CYK: Description (steps)

- Recall that the non-terminal production rules are of the form $A \rightarrow BC$ (rules are in CNF form).
- For cells representing a substring $st[i:j]$ of length ≥ 2 we assign a variable A if both:
 - $A \rightarrow BC$ is a production rule
 - $st[i:j]$ can be partitioned into two **non-empty** substrings $st[i:k]$, $st[k:j]$, such that:
 - $st[i:k]$ can be generated from variable B and
 - $st[k:j]$ can be generated from variable C

CYK: Description (termination)

- The algorithm returns **True** if and only if the cell representing the entire string $st[0:n]$ contains the start symbol S
 - This means that st can be generated from variable S

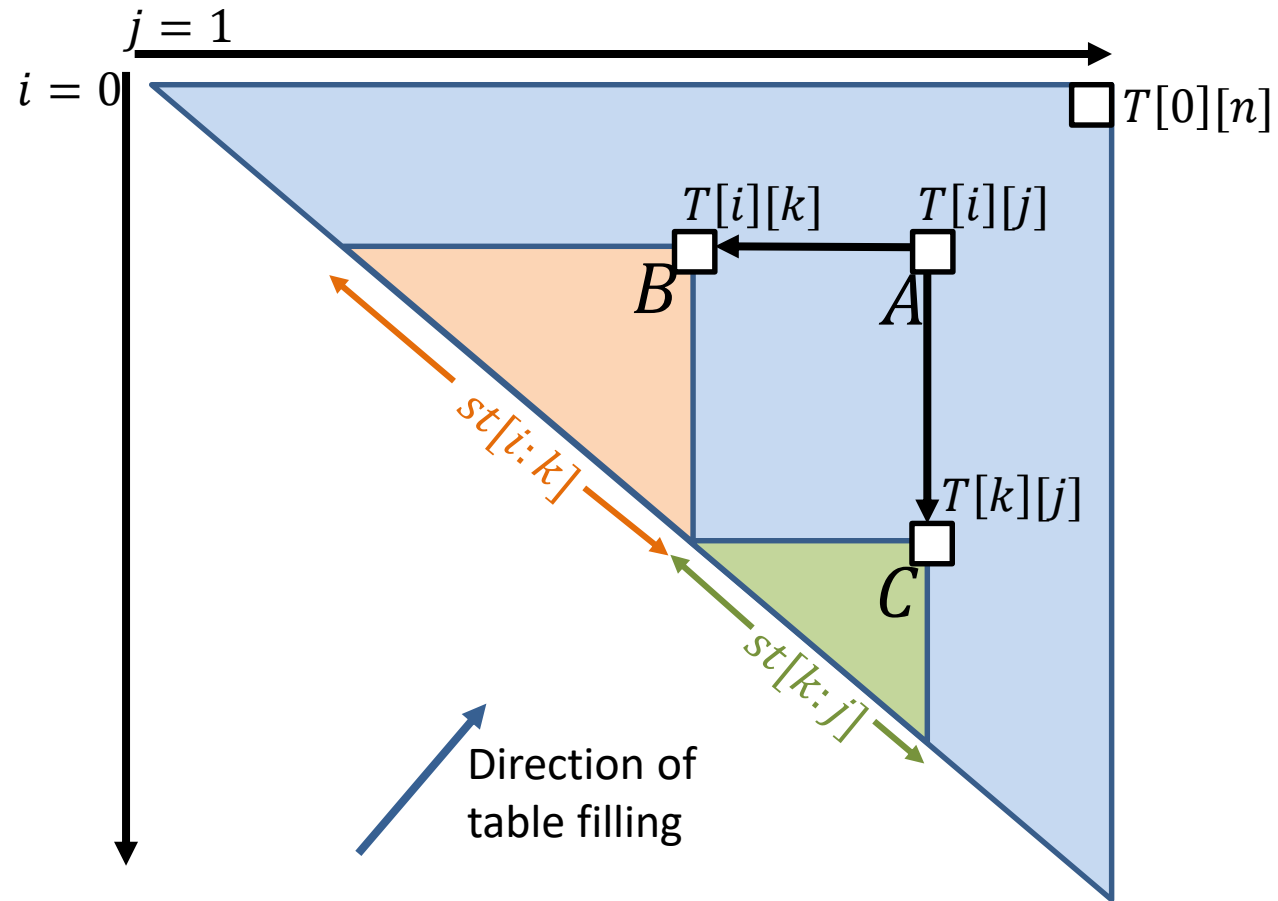

Assigning Variables to Cell $T[i][j]$

- $T[i][j]$ represents $st[i:j]$
- There are $j - i - 1$ possible **non-trivial partitions** of $st[i:j]$ into $st[i:k]$, $st[k:j]$
- According to the order of computation the corresponding cells of $T[i][k]$, $T[k][j]$ were **already assigned** with variables
- Therefore, we can construct the solution to $T[i][j]$ using solutions to **sub-problems** $T[i][k]$, $T[k][j]$, for all $i < k < j$

The Table T

$T[i][j]$ contains any variables which can derive $st[i:j]$

$$A \rightarrow BC$$

Example

Consider the following grammar:

Variables = $\{S, A, B, C\}$

Terminals = $\{a, b\}$

Rules:

- $S \rightarrow AB \mid BC$
- $A \rightarrow BA \mid a$
- $B \rightarrow CC \mid b$
- $C \rightarrow AB \mid a$

Start Variable: S

Does $st = baaba$ belongs to the language $L(G)$?

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: “baaba”

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$						
$i = 1$						
$i = 2$						
$i = 3$						
$i = 4$						

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$						
$i = 1$						
$i = 2$						
$i = 3$						
$i = 4$						

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b"				
$i = 1$			"a"			
$i = 2$				"a"		
$i = 3$					"b"	
$i = 4$						"a"

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}				
$i = 1$			"a"			
$i = 2$				"a"		
$i = 3$					"b"	
$i = 4$						"a"

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}				
$i = 1$			"a" {A,C}			
$i = 2$				"a"		
$i = 3$					"b"	
$i = 4$						"a"

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}				
$i = 1$			"a" {A,C}			
$i = 2$				"a" {A,C}		
$i = 3$					"b"	
$i = 4$						"a"

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}				
$i = 1$			"a" {A,C}			
$i = 2$				"a" {A,C}		
$i = 3$					"b" {B}	
$i = 4$						"a"

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}				
$i = 1$			"a" {A,C}			
$i = 2$				"a" {A,C}		
$i = 3$					"b" {B}	
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba"			
$i = 1$			"a" {A,C}	"aa"		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$

$A \rightarrow BA \mid a$

$B \rightarrow CC \mid b$

$C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba"			
$i = 1$			"a" {A,C}	"aa"		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba"			
$i = 1$			"a" {A,C}	"		
$i = 2$				"		
$i = 3$						
$i = 4$						

Computing $T[0][2]$:

$T[0][1] = \{B\}$
 $T[1][2] = \{A, C\}$

Is there a rule with r.h.s BA ?

- Yes! $A \rightarrow BA$
then add A

Is there a rule with r.h.s BC ?

- Yes! $S \rightarrow BC$
then add S

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa"		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa"		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa"		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa"		
				"a" {A,C}	"ab"	
					"b" {B}	"ba"
						"a" {A,C}

Computing $T[1][3]$:

$$T[1][2] = \{A, C\}$$

$$T[2][3] = \{A, C\}$$

Is there a rule with r.h.s AA ?

- No.

No rules with r.h.s AC or CA either

Is there a rule with r.h.s CC ?

- Yes! $B \rightarrow CC$

then add B

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa" {B}		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa" {B}		
$i = 2$				"a" {A,C}	"ab"	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa" {B}		
$i = 2$				"a" {A,C}	"ab" {S,C}	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa" {B}		
$i = 2$				"a" {A,C}	"ab" {S,C}	
$i = 3$					"b" {B}	"ba"
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$

$A \rightarrow BA \mid a$

$B \rightarrow CC \mid b$

$C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}			
$i = 1$			"a" {A,C}	"aa" {B}		
$i = 2$				"a" {A,C}	"ab" {S,C}	
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa"		
$i = 1$			"a" {A,C}	"aa" {B}	"aab"	
$i = 2$				"a" {A,C}	"ab" {S,C}	"aba"
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" {A,S}		
$i = 1$			"a" {A,C}	"aa" {B}	"aab" {A,S}	
$i = 2$				"a" {A,C}	"ab" {S,C}	"aba" {A,S}
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" {A,C}		
$i = 1$			"a" {A,C}	"aa" {B}	"aab"	
				"a" {A,C}	"ab" {S,C}	"aba"
					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

Computing $T[0][3]$:
 - Option #1: use
 $T[0][1] = \{B\}$
 $T[1][3] = \{B\}$
 No rule with r.h.s BB .

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" {A,C}		
$i = 1$			"a" {A,C}	"aa" {B}	"aab" {A,C}	
				"a" {A,C}	"ab" {S,C}	"aba" {A,S}
					"b" {B}	"ba" {A,S}
						"a" {A,C}

Computing $T[0][3]$:

- Option #1: use

$$T[0][1] = \{B\}$$

$$T[1][3] = \{B\}$$

No rule with r.h.s BB .

- Option #2: use

$$T[0][2] = \{A, S\}$$

$$T[2][3] = \{A, C\}$$

No rules with r.h.s AA, AC, SA, SC

$S \rightarrow AB \mid BC$

$A \rightarrow BA \mid a$

$B \rightarrow CC \mid b$

$C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" \emptyset

$i = 1$			"a" {A,C}	"aa" {B}	"aab" {B}	"aaba" {S,C,A}
$i = 2$				"a" {A,C}	"ab" {S,C}	"aba" {B}
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

The table shows the decomposition of the string "baaba" into substrings and the sets of non-terminals that can generate them. Red arrows indicate the flow of information from the final cell (i=0, j=5) to its predecessors: (i=1, j=5), (i=2, j=5), (i=3, j=5), (i=4, j=5), (i=0, j=4), (i=0, j=3), (i=0, j=2), (i=1, j=4), (i=1, j=3), (i=2, j=4), (i=3, j=4), (i=4, j=4), (i=0, j=1), (i=1, j=2), (i=2, j=2), (i=3, j=2), (i=4, j=2), (i=0, j=0), (i=1, j=1), (i=2, j=1), (i=3, j=1), (i=4, j=1).

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Example: "baaba"

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" \emptyset	"baab" \emptyset	"baaba" {S,A,C}
$i = 1$			"a" {A,C}	"aa" {B}	"aab" {B}	"aaba" {S,C,A}
$i = 2$				"a" {A,C}	"ab" {S,C}	"aba" {B}
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

$S \rightarrow AB \mid BC$
 $A \rightarrow BA \mid a$
 $B \rightarrow CC \mid b$
 $C \rightarrow AB \mid a$

Parse tree of “baaba”

$S \rightarrow AB \mid BC$

$A \rightarrow BA \mid a$

$B \rightarrow CC \mid b$

$C \rightarrow AB \mid a$

Another parse tree

$i \setminus j$	$j = 0$	$j = 1$	$j = 2$	$j = 3$	$j = 4$	$j = 5$
$i = 0$		"b" {B}	"ba" {A,S}	"baa" \emptyset	"baab" \emptyset	"baaba" {S,A,C}
$i = 1$			"a" {A,C}	"aa" {B}	"aab" {B}	"aaba" {S,C,A}
$i = 2$				"a" {A,C}	"ab" {S,C}	"aba" {B}
$i = 3$					"b" {B}	"ba" {A,S}
$i = 4$						"a" {A,C}

Implementation in Python

Representing the grammar in Python

Variables = $\{S, A, B, C\}$

Terminals = $\{a, b\}$

Rules:

- $S \rightarrow AB \mid BC$
- $A \rightarrow BA \mid a$
- $B \rightarrow CC \mid b$
- $C \rightarrow AB \mid a$

Start Variable: S

Rules are represented as a **key:value** pair in a dict:
key = the LHS variable A of these rules
value = a set of all possible RHS of the rules of the form

$A \rightarrow \dots$

Note that RHS could either be

- of length 2, representing two variables
(rule like: $A \rightarrow BA$)
- of length 1, representing a terminal
(rule like: $A \rightarrow a$)

```
>>> rule_dict = {"S": {"AB", "BC"}, "A": {"BA", "a"}, "B": {"CC", "b"}, "C": {"AB", "a"}}
>>> start_symbol = "S"
```

The variables and terminals are implicitly defined by the `rule_dict`

Running CYK Code

Variables = $\{S, A, B, C\}$

Terminals = $\{a, b\}$

Rules:

- $S \rightarrow AB \mid BC$
- $A \rightarrow BA \mid a$
- $B \rightarrow CC \mid b$
- $C \rightarrow AB \mid a$

Start Variable: S

```
>>> rule_dict = {"S":{"AB", "BC"}, "A":{"BA", "a"}, "B" : {"CC", "b"},  
"C":{"AB", "a"}}
```

```
>>> start_symbol = "S"
```

```
>>> CYK("baaba", rule_dict, start_symbol)
```

```
True
```

```
>>> CYK("baab", rule_dict, start_symbol)
```

```
False
```

CYK Code

```
def CYK(st, rule_dict, start_var):
    n = len(st)

    # Init table for the dynamic programming algorithm
    table = [[None for j in range(n+1)] for i in range(n)]
    for i in range(n):
        for j in range(i+1, n+1):
            table[i][j] = set()

    # Fill the table cells representing substrings of length 1
    fill_length_1_cells(table, rule_dict, st)

    # Fill the table cells representing substrings of length >=2
    for length in range(2, n+1):
        for i in range(0, n-length+1):
            j = i+length
            fill_cell(table, i, j, rule_dict)

    return start_var in table[0][n]
```

CYK Code (cont.)

```
def fill_length_1_cells(table, rule_dict, st):
    n = len(st)
    for i in range(n):
        for lhs in rule_dict: # lhs is a single variable
            if st[i] in rule_dict[lhs]:
                #add variable lhs to T[i][i+1]
                table[i][i+1].add(lhs)
```

```
def fill_cell(table, i, j, rule_dict):
    for k in range(i+1, j): # non trivial partitions of s[i:j]
        for lhs in rule_dict: # lhs is a single variable
            for rhs in rule_dict[lhs]:
                if len(rhs) == 2: # rule like A -> XY (not A -> a)
                    X, Y = rhs[0], rhs[1]
                    if X in table[i][k] and Y in table[k][j]:
                        table[i][j].add(lhs)
```

Computability of Grammar-Related Problems

- **Language equality**: Given two CFGs, do they generate the **same** language?
- **Language inclusion**: Given two CFGs, can the first one generate all strings that the second one can?
- **Grammar ambiguity**: Given a CFG, is it ambiguous?
- **Language disjointness**: Given two CFGs, is there any string derivable from **both** grammars?

Can you guess what's in common to these problems?
